AWARENESS • APPRECIATION • STEWARDSHIP

The Student Stewards Program presents: What's Your Habitat?

All forms of life, from humans to cows to bears to flowers, need certain things to live. Survival depends on getting enough food, water, shelter, and space to live.

Example: Our rainbow trout's habitat is the river, where it eats macroinvertebrates, has plenty of water, lives next to rocks where it can hide, and has space to grow and have offspring.

Now it is your turn to draw your habitat in the empty box below!

Remember to leave space around the house to add other parts of the neighborhood. Try to include in your drawing the following: a food source, a water source, and shelter from the elements. What other habitat elements do you need to survive? Use different colors to represent each of the four basic needs and write it on the bottom of the paper to remember.

Draw your Habitat:

Great job, you have just drawn your own habitat!!

Habitat is home, the place where humans get all that they need to survive. Habitat is where all animals satisfy the most basic survival requirements - food, water, shelter, and space to live and have a family.
