

TRUCKEE MEADOWS PARKS FOUNDATION

AWARENESS • APPRECIATION • STEWARDSHIP

Help us find the best release spot for our trout! In the video we learned macroinvertebrates can help indicate water quality, and some are a great source of food for our trout. Below are four samples of macroinvertebrates taken from potential release sites. Color the macroinvertebrates based on what pollution group they fall into. Tally how many critters are in each group for all samples and then circle the habitat that has the best water quality and food for our trout!

Red = Very tolerant of pollution	Green = Medium intolerance to pollution
Orange = Tolerant of pollution	Blue = Intolerant to pollution
